A

A progression score is more useful when its basis remains visible

One synthetic follow-up example. The report keeps image evidence and treatment context separate.

Earlier scan Current scan

Synthetic MRI illustration, not a patient image

Treatment course

8 weeks after radiotherapy

What PRISM keeps separate

Two sources can support a score differently.

Image evidence
Enhancing volume increased
Image score **0.64**

Treatment context
Early after radiotherapy
Timeline score **0.21**

The pathways disagree
The report makes the disagreement visible instead of hiding it in one score.

Report for this scan SYNTHETIC

Image evidence
Enhancing volume increased from the earlier scan.

Treatment context
This scan is early after radiotherapy.

Pathways
Image and timeline scores disagree.

Evidence in this situation
Few comparable scans were available.

Each statement is checked against the source record.
