A **A PRISM report (synthetic example)**

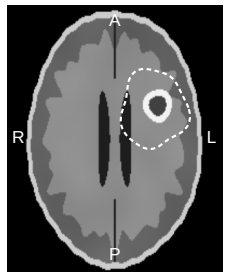

PRISM surveillance report

SYNTHETIC EXAMPLE

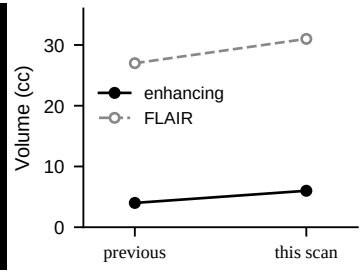

Scan 8 weeks after the end of radiotherapy · compared with the previous scan · models from MU

This scan

Previous scan, same slice

Dashed: FLAIR outline.
Drawn, not a patient image.

SCAN

This scan was taken 8 weeks after the end of radiotherapy, early after radiotherapy.
`scan.phase`

The automatic segmentation gives indicative volumes of 6.0 cc enhancing tumour and 31.0 cc FLAIR hyperintensity.
`meas.label, meas.enhancing_cc, …`

Enhancing tumour is 2.0 cc larger than at the previous scan.
`meas.enhancing_change_…`

PATHWAYS

The timeline pathway is based on clinical data and the position in treatment: timeline score 0.21, below the median of its scores in the MU-Glioma-Post evaluation scans (0.38).
`pathway.timeline.*`

The image pathway is based on the segmented tumour and its change: image score 0.64, above the median of its scores in the MU-Glioma-Post evaluation scans (0.45).
`pathway.images.*`

The two pathways disagree: the timeline score is below its median and the image score is above its median.
`pathways.agreement_statement`

COMBINED

The combined score, based on the inputs of both pathways, is 0.33.
`pathway.combined.*`

Each score is a model output between 0 and 1 that ranks scans by how closely they resemble the progression scans of the training data; it is not a diagnosis and not a calibrated probability for this patient.
`pathways.score_meaning`

The 80% conformal set holds both outcomes.
`conformal.combined.80.statement`

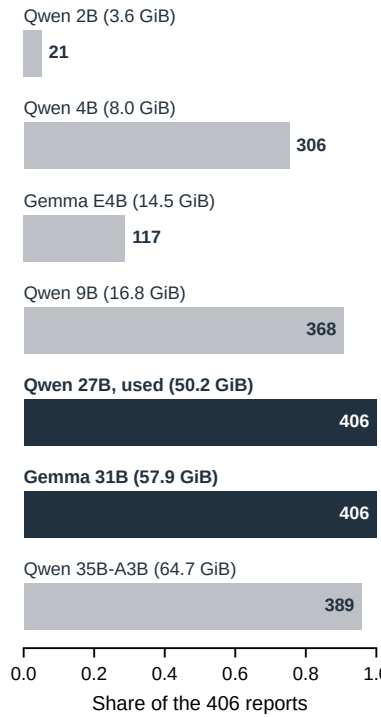

TRUST

This situation, early after radiotherapy with enhancing tumour increased, has few cases: 1 of 9 scans was progression.
`card.situation, card.tier_statement`

The pathways disagree flag is raised: the timeline score is below its median and the image score is above its median.
`flags.disagreement.*`

Fixed limitations section (excerpt): the scores rank scans; they are not a diagnosis and the report gives no recommendation or decision. No clinician has evaluated this report.

B **Reports passing the check**

Dark: ≥ 95% in every cohort; light: below 95% in at least one. Same prompt for all.
