A Data
MU-Glioma-Post
development
155 patients, 308 index scans
grade 4: 126 patients, 249 scans
LUMIERE
external test
61 patients, 132 index scans
CFB-GBM
diffusion (ADC)
77 patients with ADC
Definitions
Index scan: MRI before the first documented progression, with T1, T1c, T2, FLAIR and tumour mask
Outcome: documented progression within 120 days; censored at last follow-up or death
B Evaluation
Initial single split
29 test patients
500 splits
same design, different test patients
Repeated cross-validation
5 × 5 folds, grouped by patient
every fitted step inside the training fold
LUMIERE
locked external test
CFB-GBM
cross-validation
C PRISM and the questions
Core model
clinical + treatment course
+
Optional imaging branches
volumes, radiomics, deep encoder (frozen or fine-tuned)
Per-scan audit record
Grounded report
Prespecified questions (Table 4)
1 Does imaging add to the core model?
2 Is the phase of care a censoring artefact?
3 Does the audit work?
4 Are reports faithful and complete?
